

Hypothesis, Theory, and Law

A hypothesis is a prediction
Of what you think your data will show
Your observations
It has not been proven until your done

An experiment will let you know
If you're right or wrong your data will show
Which way you should go
Analyze your data and then you'll know

A theory is more than a guess
It's something that has been proved

An explanation based on observations
Its been verified multiple times
Its been analyzed
It has to be proven many times

A scientific law is more than a rule
It's a statement of fact
But it still could change if, oh it still could change if
But it still could change if we find something new
It could keep on changing, it could keep on changing
It could keep on changing if we find something new
